

AL-MAJAL JOINS GJU- GEA TEAM

“I was very happy when I was chosen for a part-time job in the project team. With this step, I felt that I was on the right path, as I would be able to work with a distinguished and qualified team and gain more experience and skills from them.”

My passion and interest in the field were among the most important reasons that encouraged me to enroll in the Energy Efficiency Program, and what sparked my interest even more was the program's emphasis on the practical and training side, the scientific and practical backgrounds of the faculty members in charge of it, and my desire to begin working and building a professional career in the field of energy efficiency.

My perspective on various topics changed as the program progressed, as I am now able to identify and distinguish between correct and incorrect practices and habits, particularly in the usage of electricity and paying attention to the devices that we have!

Practical training, field visits to companies and factories, and conducting studies on the ground in order to apply what we learned added a lot of experience and self-confidence.

I am seeking to gain more experience and work in this field and establish my own company to transfer knowledge educate people and help them learn the correct use of energy and choose the most suitable devices for them, which will bring great benefits to the individual, society, economy and the environment.

Ibraheem holds a degree in Energy Engineering from the German Jordanian University.

He worked before joining the program as a supervisor on a PV project with a capacity of 1 megawatt, in addition to his work as an electrical engineer in a photovoltaic project with a capacity of 6.25 megawatts in the Social Security Corporation in the Al-Rama area.
